

How and when will the EWP Network connect to the Mobility Tool+?

EWP and the Mobility Tool+ (MT+) team have been working to connect the EWP Network to the MT+. At present, specifications have been developed and agreed upon and basic connectivity realised; furthermore, the University of Porto created a network node for the exclusive usage of MT+. This [network node](#) will handle all the security and verification steps pertaining to requests made from the EWP Network directed to the MT+, and ensure the connection with their servers. The node also handles responses from the MT+ servers and ensures their accurate delivery to the relevant node in the EWP network. Furthermore, three relatively simple [APIs](#), for reading data from the tool were designed, tested and posted in the PROD Network. The more important APIs - for the automatic reporting of the mobility data - are still being developed and tested by the involved technical teams.
